

Practical 3 Working UI

Create a new project “Practical3”:

1. Create an application with 4 RadioButtons to control the choice of background colour using XML to design the layout.
2. Create an option menu with 2 options, one to proceed to another page and one to exit the application.
3. Modify the application created to use separate Fragments to display background colour in response to RadioButton selected.

Home work:

Create a context menu which is triggered when a TextView is long-click on. It then offers 3 options, which after the user selects any of the options, will display a message (different message for each option).
