

Practical 5 SQLite

Create a new project “Practical5”:

1. Try to produce a simple application that extracts all information stored in the SQLite database with a single content.
2. Use the ideas from Q1, modify the SQLiteAdapter to create a table with one auto-increment ID and 3 other content fields (2 Strings and 1 integer).
3. Show only results that are fulfilling specific criteria for one of the String content.
4. Sort the data according to the other String content.
5. Show the sum of the integer based on the String content.
6. Allow user to key in the information from the interface and display upon a button click.
